

Work done by Force

Question Paper 3

Level	International A Level
Subject	Maths
Exam Board	CIE
Topic	Energy, Work and Power
Sub Topic	Work done by a force
Booklet	Question Paper 3

Time Allowed: 61 minutes

Score: /51

Percentage: /100

Grade Boundaries:

- 1 A particle of mass 0.8 kg slides down a rough inclined plane along a line of greatest slope AB . The distance AB is 8 m . The particle starts at A with speed 3 m s^{-1} and moves with constant acceleration 2.5 m s^{-2} .

(i) Find the speed of the particle at the instant it reaches B . [2]

(ii) Given that the work done against the frictional force as the particle moves from A to B is 7 J , find the angle of inclination of the plane. [4]

When the particle is at the point X its speed is the same as the average speed for the motion from A to B .

(iii) Find the work done by the frictional force for the particle's motion from A to X . [3]

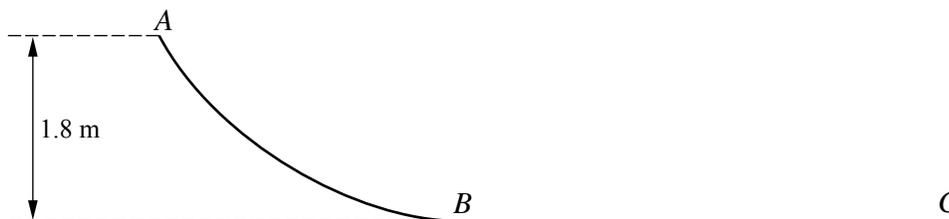

- 2 A cyclist, working at a constant rate of 400 W , travels along a straight road which is inclined at 2° to the horizontal. The total mass of the cyclist and his cycle is 80 kg . Ignoring any resistance to motion, find, correct to 1 decimal place, the acceleration of the cyclist when he is travelling

(i) uphill at 4 m s^{-1} ,

(ii) downhill at 4 m s^{-1} .

[5]

3

The diagram shows the vertical cross-section ABC of a fixed surface. AB is a curve and BC is a horizontal straight line. The part of the surface containing AB is smooth and the part containing BC is rough. A is at a height of 1.8 m above BC . A particle of mass 0.5 kg is released from rest at A and travels along the surface to C .

(i) Find the speed of the particle at B . [2]

(ii) Given that the particle reaches C with a speed of 5 m s^{-1} , find the work done against the resistance to motion as the particle moves from B to C . [2]

- 4 A car of mass 1250 kg travels along a horizontal straight road. The power of the car's engine is constant and equal to 24 kW and the resistance to the car's motion is constant and equal to R N. The car passes through the point A on the road with speed 20 m s^{-1} and acceleration 0.32 m s^{-2} .

(i) Find the value of R . [3]

The car continues with increasing speed, passing through the point B on the road with speed 29.9 m s^{-1} . The car subsequently passes through the point C .

(ii) Find the acceleration of the car at B , giving the answer in m s^{-2} correct to 3 decimal places. [2]

(iii) Show that, while the car's speed is increasing, it cannot reach 30 m s^{-1} . [2]

(iv) Explain why the speed of the car is approximately constant between B and C . [1]

(v) State a value of the approximately constant speed, and the maximum possible error in this value at any point between B and C . [1]

The work done by the car's engine during the motion from B to C is 1200 kJ.

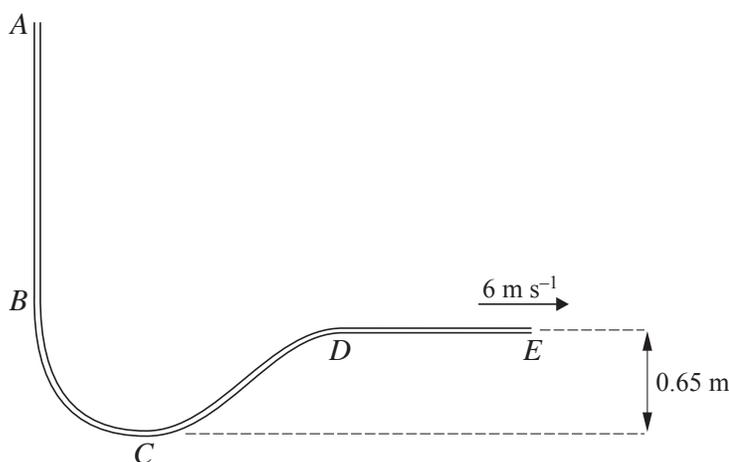

(vi) By assuming the speed of the car is constant from B to C , find, in either order,

(a) the approximate time taken for the car to travel from B to C ,

(b) an approximation for the distance BC .

[4]

5

A smooth narrow tube AE has two straight parts, AB and DE , and a curved part BCD . The part AB is vertical with A above B , and DE is horizontal. C is the lowest point of the tube and is 0.65 m below the level of DE . A particle is released from rest at A and travels through the tube, leaving it at E with speed 6 m s^{-1} (see diagram). Find

(i) the height of A above the level of DE , [2]

(ii) the maximum speed of the particle. [2]

6

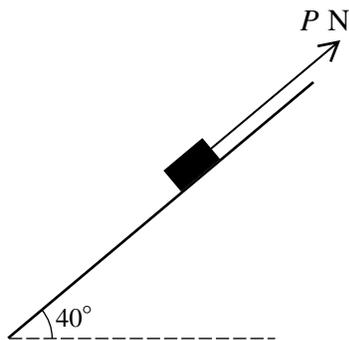

Fig. 1

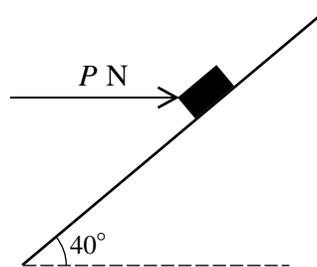

Fig. 2

A small block of weight 12 N is at rest on a smooth plane inclined at 40° to the horizontal. The block is held in equilibrium by a force of magnitude $P\text{ N}$. Find the value of P when

- (i) the force is parallel to the plane as in Fig. 1, [2]
- (ii) the force is horizontal as in Fig. 2. [2]

7

A car of mass 1250 kg travels along a horizontal straight road with increasing speed. The power provided by the car's engine is constant and equal to 24 kW . The resistance to the car's motion is constant and equal to 600 N .

- (i) Show that the speed of the car cannot exceed 40 m s^{-1} . [3]
- (ii) Find the acceleration of the car at an instant when its speed is 15 m s^{-1} . [3]

8 A block of mass 20 kg is at rest on a plane inclined at 10° to the horizontal. A force acts on the block parallel to a line of greatest slope of the plane. The coefficient of friction between the block and the plane is 0.32 . Find the least magnitude of the force necessary to move the block,

- (i) given that the force acts up the plane,
- (ii) given instead that the force acts down the plane.
