

# Linear Motion under a Variable Force

## Question Paper 5

<b>Level</b>	International A Level
<b>Subject</b>	Maths
<b>Exam Board</b>	CIE
<b>Topic</b>	Linear Motion under a Variable Force
<b>Sub Topic</b>	
<b>Booklet</b>	Question Paper 5

**Time Allowed:** 62 minutes

**Score:** /51

**Percentage:** /100

**Grade Boundaries:**

A*	A	B	C	D	E	U
>85%	77.5%	70%	62.5%	57.5%	45%	<45%

- 1** A particle  $P$  of mass  $0.5$  kg moves along the  $x$ -axis on a horizontal surface. When the displacement of  $P$  from the origin  $O$  is  $x$  m the velocity of  $P$  is  $v$  m s<sup>-1</sup> in the positive  $x$ -direction. Two horizontal forces act on  $P$ ; one force has magnitude  $(1 + 0.3x^2)$  N and acts in the positive  $x$ -direction, and the other force has magnitude  $8e^{-x}$  N and acts in the negative  $x$ -direction.

(i) Show that  $v \frac{dv}{dx} = 2 + 0.6x^2 - 16e^{-x}$ . [2]

(ii) The velocity of  $P$  as it passes through  $O$  is  $6$  m s<sup>-1</sup>. Find the velocity of  $P$  when  $x = 3$ . [5]

- 2** A particle  $P$  of mass  $0.5$  kg moves on a horizontal surface along the straight line  $OA$ , in the direction from  $O$  to  $A$ . The coefficient of friction between  $P$  and the surface is  $0.08$ . Air resistance of magnitude  $0.2v$  N opposes the motion, where  $v$  m s<sup>-1</sup> is the speed of  $P$  at time  $t$  s. The particle passes through  $O$  with speed  $4$  m s<sup>-1</sup> when  $t = 0$ .

(i) Show that  $2.5 \frac{dv}{dt} = -(v + 2)$  and hence find the value of  $t$  when  $v = 0$ . [7]

(ii) Show that  $\frac{dx}{dt} = 6e^{-0.4t} - 2$ , where  $x$  m is the displacement of  $P$  from  $O$  at time  $t$  s, and hence find the distance  $OP$  when  $v = 0$ . [5]

- 3** A particle of mass  $0.4$  kg is released from rest and falls vertically. A resisting force of magnitude  $0.08v$  N acts upwards on the particle during its descent, where  $v$  m s<sup>-1</sup> is the velocity of the particle at time  $t$  s after its release.

(i) Show that the acceleration of the particle is  $(10 - 0.2v)$  m s<sup>-2</sup>. [2]

(ii) Find the velocity of the particle when  $t = 15$ . [5]

- 4 A particle starts from rest at  $O$  and travels in a straight line. Its acceleration is  $(3 - 2x) \text{ m s}^{-2}$ , where  $x \text{ m}$  is the displacement of the particle from  $O$ .
- (i) Find the value of  $x$  for which the velocity of the particle reaches its maximum value. [1]
- (ii) Find this maximum velocity. [4]
- 5 A cyclist starts from rest at a point  $O$  and travels along a straight path. At time  $t \text{ s}$  after starting, the displacement of the cyclist from  $O$  is  $x \text{ m}$ , and the acceleration of the cyclist is  $a \text{ m s}^{-2}$ , where  $a = 0.6x^{0.2}$ .
- (i) Find an expression for the velocity  $v \text{ m s}^{-1}$  of the cyclist in terms of  $x$ . [4]
- (ii) Show that  $t = 2.5x^{0.4}$ . [3]
- (iii) Find the distance travelled by the cyclist in the first 10 s of the journey. [2]
- 6 A particle of mass  $0.25 \text{ kg}$  moves in a straight line on a smooth horizontal surface. A variable resisting force acts on the particle. At time  $t \text{ s}$  the displacement of the particle from a point on the line is  $x \text{ m}$ , and its velocity is  $(8 - 2x) \text{ m s}^{-1}$ . It is given that  $x = 0$  when  $t = 0$ .
- (i) Find the acceleration of the particle in terms of  $x$ , and hence find the magnitude of the resisting force when  $x = 1$ . [3]
- (ii) Find an expression for  $x$  in terms of  $t$ . [6]
- (iii) Show that the particle is always less than  $4 \text{ m}$  from its initial position. [2]
